

ACTIVATE FRIDAY

Advice/Things to look into

- Tgrp - tech grad rotation program
- Come back in summer for SPARK - Siva
- Reaching out to managers/turnaround times (time for managers to respond)
 - How too talk corporate
 - How to integrate well into a team
 - When you're reaching out after the co-op, what should you talk about
 - Who was The last co-op that really impressed you & how did they do that
- Talk to uni about 2 co-op activities needed a term?
- Steps to take to become a Chief ai officer (caio)
- Learn how to master team culture

Skills learned

- Effective comm (using simple lang and breaking tech terms into plain english)
- Jean wu
- Russell chan
- Learn tech skills and soft skills

Make a general resume for each role to not need to need to tailor your resume

Ti9 or Ti ni

- Is CAI your main work
- How was CAI made, how did you take GPT and make a wrapper for CIBC. Did you build CAI from the ground up. I'm trying to imagine how CAI came to be and how I could potentially recreate it

- Are agents unique to CAI, were they built specifically for CIBC. Do you know of any other chat bot with smt similar
- What will happen to my agents when I leave this term
- CAI agents use tokens, will smart libraries use those tokens (No)

PROGRESS BLOG

17/09/25

I started last week, I did not do much aside from mandatory e-learning and attending Microsoft 365 "workshops". I've met many people, majority of which I'll be working with. My primary stream (focus) for this work term is Business Analyst (BA), with a secondary one in QA and associated automation. Every 2 weeks or so I'm suppose to switch "tertiary stream", these take up about 15% of my work time, secondary 25 - 35 %, and primary 50 - 60%.

BA:

What I've done:

I have been working with Ana and Christian. We are working on a project to upgrade from CPE v4 (our current system in use for deposit products and cash management) to CPE Zafin Saas. I've taken the functional requirements of the CPE Upgrade Deposits BRD and placed them into a traceability matrix. In addition, since cash management and deposit products are similar, I've made a duplicate of the deposit products BRD and tailored it to fit cash management.

What I'll work on next:

- I will read on CPE v4 and how it differs to CPE Zafin Saas to gain a better understanding of the project.
- Better understand the difference between deposit products and cash management.
- A potential Goal of mine could be making my own BRD.

Agile - working as scrum

What I've done:

I've attended the agile standups and have listen and written down what bits of what the dev, qa, and ba teams have been working on. After observing Laura (the scrum master) for 5 days, I took on the responsibility of leading these standup meetings.

Qa and automation

- Learned COINS
- Mapped fsd to brd requirements, used cai to optimize
- Created an agent to make a traceability matrix

Week 3 & 4

29/09/25

These 2 weeks I did not really do that much work compared to week 2. Things are starting to pick up a bit and my days are filled with 4-6 meetings. The workload for BA was light since we were waiting on the Zafin fsd to be released, I was introduced to QA work and continued to lead the Agile stand-ups

BA:

I was tasked with taking the brd requirements and finding relating fsd requirements. Instead of manually going through the 83 page FSD, I used CAI. By prompting the task I needed to do (directions), and an example of the result I needed, I managed to map the FSD to appropriate BRD requirements in about an hour. Seeing as all my BA work to this point has been linked to making a traceability matrix, I made a CAI agent that would do just that. It's a simple agent without heavy testing, but essentially, the user uploads a BRD, SRD, and FSD and the agent will build a full matrix that can be copied and pasted into excel. For the time being, the user will still have to ensure that the mapping was done successfully and correctly. At the moment when measuring the time needed for the agent to build the matrix and for the user to review it, we're

looking at 1-2 hours. Comparing this to if the user was manually building the matrix we're looking at 3-5 hours for mapping the BRD and SRD, and days to map the BRD and FSD. Once optimized The agent will save CIBC Bas roughly 3-5 hours of work by building the entire traceability matrix under 5 minutes. At the moment, I am waiting for us to officially kickstart the Cash management side, meaning I will add to the BRD skeleton we have, make a SRD, and new traceability matrix.

QA:

I was introduced to COINS, which is essentially a UI for bank branches to complete their work (e.g. opening and closing accounts, creating reports, etc.). The application is a part of CDS, as it gathers and uses information from other CDS apps (such as ECIF) and also gives required information to those same CDS apps. I will be working with Sara and Shipra Archarya to automate testcases for the basic panel and "27". On the week of the 29th, I familiarized myself with the functions of COINS that I will be automating, and I started learning about UFT. On the week of the 6th, I will be executing small testcases already built, in preparation of writing scripts.

- Talk to Eva, first impression: "I will make myself available" = "I'm doing a service to you"
- Ask Ana, and Christian, "We just finished the BRD, what is the next step, and how can I prepare for it? Also if you don't mind, could you please provide me feedback on my work."

Please be honest, do you feel as though I'm making a difference or helping the team in a significant way? If not, how can I change that? Do you have any complaints, is there anything I can improve on? We were talking about maybe doing a lunch and learn for the BAs on how to use CAI, should I talk to Eva about it and see how we could possibly make that happen?"

-
- Talk to Suritha, Rasmita, and Lisa asking to verify what is expected of me (now and in the future). "Just for peace of mind, I wanted to make sure I'm meeting expectations, Sara and I are validating Oracle requests from Maria; Automating 16 test cases in the T5 environment. Because there is only 1 working machine, Sara is automating the test cases & I'm expected to do the validation. Soon we will be scripting in UFT, may I also automate even 1 or 2 test cases to have that experience as well? Aside from UFT, I remember we were talking about Mainframe, will that still be something Sara and I will work on? If so, how can I prepare myself? Also if you don't mind, could you please provide me feedback on my work."

Please be honest, do you feel as though I'm making a difference or helping the team in a significant way? If not, how can I change that? Do you have any complaints, is there anything I can improve on"

- Ask Sara to allow me automate some test cases

please be honest, do you feel as though I'm making a difference or helping the team in a significant way? If not, how can I change that? Do you have any complaints, is there anything I can improve on?

Weeks 5 - 8

BA:

BRD

Made a CAI brd: Trying to push the limit of how we could use CAI, Christian and I wanted to make a BRD using CAI. I made a simple agent telling CAI to take a user's template for a BRD, this would be how CAI would know what sections to add and how to format. Then I told it that the user will upload files and give a subject line to focus on. CAI's job would then be to create the sections from the BRD template and to populate the sections with information from the uploaded documents related to the user's given subject line of focus. I went through the CPE - Upgrade CM folder and downloaded all the files within its subfolders and fed them to CAI with the Deposits Products BRD as a template and with a focus on **the requirements of Cash Management pertaining to it's fees**. CAI gave a well structured BRD with some new functional requirements that we did not have in the Deposits BRD tailored to Cash Management.

With Christian's guidance, I then made new agent to help compare the two BRDs (CAI's CM BRD and our CM BRD draft). We told CAI focusing on the functional requirements, list all the similar requirements from both BRDs in a table. CAI's on the left, ours on the right. Christian then went through each requirement and selected which version of the requirement would be better, CAI's or ours. Finally, we took all the remaining requirements from each BRD and determined whether or not they would be necessary. This is how we completed our CM BRD draft. We went over this "final" draft with Ana in case there were some missing points

Work Assigned by Eva

I had scheduled a meeting with Eva and Alberta where I had demoed my traceability matrix generator agent and how I wanted to go beyond and find more potential CAI use cases. Eva gave me 2, creating user stories, and populating relevant columns of a massive excel database for the ADAM project using different files in SP.

1. As requested by Eva, I met with Jill and Duncan two Sr Business Analyst working on Sales Force. They were finishing up making user stories from their BRD. In our meeting, I shared that I would like to make a CAI agent that created user stories based off a given BRD, the ultimate goal would be recreate Duncan and Jill's exact list of user stories. I showed them a draft of what I had done in preparation for the meeting. The agent was simple, it took the functional requirements of a BRD and gave stories with one tasks with the std form I was taught at uni, As a ... I want to ... so that ... Duncan and Jill saw some potential in this and suggested that I change the formatting to CIBC's std and that I tweaked the agent so that the formatting would come out in the form of a table, and CAI would mention these for the user: Tech Considerations, Assumptions, Dependencies, and Constraints. I uploaded the agent to marketplace and asked the both of them if they could try it out on their own and if they could give me feedback on how could improve the agent. For the time being, it gives a traceability matrix, mapping the user stories to the uploaded BRD, gives a user story tab with each user story broken down into a table for easier understanding
2. I'm not too entirely sure where to start for the database, let alone what do. I've scheduled a meeting with Alberta to over this and to receive more clarification.

I forgot to write

- Improved traceability matrix agent

I ran into an issue with the Traceability Matrix Agent where it did not accurately map the FSD to the BRD. It would often add ghost sections from the FSD when mapping to the BRD, most of which simply did not exist in the FSD. Zafin had created their own version of the traceability matrix which had what they believed to be the full mapping of the FSD to the BRD. Using this matrix as a guide, using CAI, I refined the section of the prompt which was responsible for the mapping. As of 15/12/2025, the FSD mapping is on average 60-80% accurate (sometimes even 100% accurate). In addition, the SRD to BRD mappings present in the SRD where also no where to be found. Only 1 SRD solution requirement would be present and at most 3. The issue with these mappings stem from the amount of information I wrote in the prompt for each mapping. I wrote about 2 lines for the SRD mapping and a long list of text for the FSD (this prompt used ~5% of total tokens alone). I had to reduce the amount of text I was feeding CAI to avoid overloading it. I learned the hard way that the more information you feed to an LLM, the more

- Ran traceability matrix on 5.0 and received better output

- Published Traceability Matrix and User Story Generators to marketplace
- Went over etl files and determined optimal running frequency
- verified transactions in COINS to match those in an excel sheet
- Created new COINS accounts
- We're moving from automating through UFT to python
 - Wrote a demo script automating adding 4 + 4 on the calculator app
- Going through GEMS accounts' list, ensuring all accounts are active
- Hosting calls with Alex, Matthew, and Aarav to teach how I've made my agents and how to use CAI
 - Preparing presentations to showcase how to utilise my agents
- Looking to make an in depth presentation/guide on how to use CAI
- Improve Traceability Matrix Generator to correctly map to FSD
- Improve User story Generator to provide more in depth results and building on top off the one already in marketplace
- Make trans (tdy until 21st)
- Database (adding missing data elements from las)
- Presented in team meetings (Alex++, BAs, QA) how to make CAI agents
- Made AI prompts/scripts
- Used AI to build scripts
-
- Working on
 - Sales Force (BRD, ask for SP access)
 - AIS

- CM
- Deposit Product

A script that reads a requirement

Then reads one line of the FSD and asks if it's related to the requirement

If yes then store

If no then move to the next FSD line.

Repeat for the whole text

Print the lines that were stored

Are there outside guides to map

IA's in BA work

Compare info in the data dictionary to the CPI & EDFSA IAs

If info is in the IA and not in excel add

Inverse, highlight in excel

What have I learn

- How to optimize AI prompts (lost in the middle effect)
- How to utilize ai to complete documentation
- Types of BA documentation (BRD, SRD, traceability matrix, data dictionary, IA)

NEXT CO-OP TERM

Do next co-op

1. Write code that automatically prompts CAI to fill out a document (e.g. BRD maker)
2. Research Agentic AIs
3. Complete CAI agents
 - a. Goal Ideas for Co-ops
 - b. Brd Maker,
 - c. Comparing BRD (maybe look to broaden this to comparing different docs based of a user's description)
 - d. Replying/Drafting Emails
4. Look at integrating python with CAI
 - a. **python code to automate making scripts**
 - i. the code will ask for a prompt from the user
 - ii. The user will give a detailed explanation of the code they want to write
 - iii. Python will open CAI and share the prompt
 - iv. Take CAI's response and write it VsCode or notepad
 - v. The program will run the new code
 - vi. Example:
 1. Make a python code that Opens my desktop's Calculator app, adds 4 + 4, prints the result in the terminal
 2. Copy CAI's code
 3. Create a new notepad file
 4. Paste the code
 5. Close the notepad file
 6. Run the file
 7. Stop running the code & program once the result is printed
